[The effects of vitamin E on the prognosis of chronic heart failure: a meta-analysis of randomized controlled trial]. The role of vitamin E in the treatment of chronic heart failure (CHF) is controversial. We designed this meta-analysis to evaluate the effects of vitamin E on the prognosis of CHF. We performed a comprehensive search in the following four electronic databases: Chinese Biomedicine Database, Cochrane Library, EMBASE, and MEDLINE for randomized controlled trials (RCTs) on vitamin E versus placebo or no treatment in patients with CHF, published in English or Chinese by January 1, 2011. Primary outcome was all-cause mortality. Secondary outcomes included the incidence of CHF and cardiovascular events (cardiac death and nonfatal myocardial infarction). The quality of the included studies was assessed by the Jadad scale. Thirteen RCTs were included in this meta-analysis. Compared with the control group, vitamin E significantly decreased all-cause mortality (OR=0.79, 95% CI 0.65-0.97, P=0.02), and the incidence of CHF (OR=0.75, 95% CI 0.61-0.93, P=0.01). However, there was no difference in the incidence of cardiovascular events (OR=0.73, 95% CI 0.47-1.13, P=0.15). Vitamin E significantly improves the prognosis in patients with CHF.
