Season 1.1 Season 1.2 Season 2.1 Season 2.2 Season 3 Episode 4 External links Category:Video on demand services(A red dot in the center of the graph indicates error in acceptance efficiency due to the finite MC statistics) For this analysis, we study two detector efficiencies. The first is a theoretical efficiency, which is identical to the efficiency of the fundamental mode cavity as calculated by the MBB simulation software. This is the most conservative estimate of the efficiency. The second efficiency is the simulated reconstruction efficiency for tracks entering the TPC. This is the same as the efficiency for the signal tracks used to determine the trigger efficiency, but is lower than the efficiency calculated for the candidates. For this analysis, we use the peak efficiency obtained from a particle MC simulation, which is shown as the light blue region of Fig. \[fig:accept_efficiency\]. In addition to these simulated efficiencies, we apply experimental systematic uncertainties for the energy scale (assumed to be 0.5%), the front-end electronics calibration (assumed to be 1%), and the DC strips (assumed to be 10%) to the simulated efficiency. This yields the total efficiency shown in Fig. \[fig:accept_efficiency\]. Estimating the real efficiency from data is nontrivial. First, we note that the detector response to laser tracks is negligible compared with the laser energy itself, as seen in the detector acceptance for laser particles in Fig. \[fig:detector_acceptance\]. Thus, the trigger efficiency is estimated by applying the trigger to the laser detector, and counting the number of background events that remain for further analysis. Furthermore, laser background tracks tend to propagate in the backplane of the experiment, whereas charged particle trajectories tend to follow the front-end electronics. It is not possible to separate tracks from the two components. Instead, we introduce a 30 cm front-end electronics calibration uncertainty into the analysis to account for the possible underestimation of the detector response. !\[fig:accept_efficiency\] Comparison of the efficiency obtained from the Monte Carlo (blue) and from data (yellow). The uncertainty is the quadrature sum of the statistical uncertainty and the systematic uncertainty used for this analysis.](efficiency_evlan.pdf){width="linewidth"} [3da54e8ca3
