The most popular version of Photoshop is Photoshop CS6, released in 2013. The last version of Photoshop to ship with Windows OS was Photoshop CS3 (released in 2004). Photoshop is a very powerful program, but it is also complex, and it has many nuances, features, and concepts to master. The primary components of Photoshop are the following: The **document** : The basic unit of information for Photoshop. You can edit it in various ways, including selecting, moving, rotating, scaling, changing color, and embedding fonts. The **layers** : You can use layers to composite images together, with each layer representing a distinct area of an image. Each layer is stored as a file, and you can move, resize, rotate, and place them anywhere in the image. You can even merge layers, which lets you view or edit them simultaneously. The **palettes** : Photoshop allows you to customize the colors of any image. The **Quick Selection tool** : The Quick Selection tool enables you to select areas of an image that you can drag to other areas of the image or into other images. You can also use the tool to crop an image by selecting the area you want to keep and then dragging the cropping border on to the edges of your image. The **lasso tool** : The lasso tool enables you to draw on your image. By holding down the mouse button, you can draw a line that changes color to indicate your path. The **rubber band tool** : This tool lets you snap to specific points in an image, like the corners or edges of a rectangle or square. The **Layer Mask** : This tool allows you to control which areas of an image are affected by the changes you make to the image, such as cropping or recoloring. The **Brush tool** : The Brush tool allows you to paint areas of an image, such as backgrounds or objects. Here's what Photoshop's interface looks like: ## Working in Photoshop Photoshop is an all-encompassing program that lets you perform many functions. While it's a powerful program, it isn't overwhelming. You can get everything done in Photoshop with a minimum of technical expertise. Laser techniques for the treatment of liver cancer By Jan Slee Press Trust of India December 1, 2012, 12:12 IST Dr Vilas Parani, Executive Vice President - Scientific & Corporate Affairs, HAL, Dr BS Rathur, Executive Vice President (R&D), HAL and Dr Harshad Arora, Managing Director, LaserMentor, India discuss the applications of the Intense Pulsed Light Technology : Pakistan must move away from its military intervention in north India and should focus on strengthening its domestic economy, according to one of its former presidents, while another suggested that Pakistan should leave Kashmir to India and Pakistan. In a conversation with Hindustan Times, before the release of former President Pervez Musharraf's book "The Way Out: The Untold Story of the Inception of Kargil War", on the 10th anniversary of his retirement from office, Musharraf said: "The time has come to realise that both sides suffer and that this conflict has to be resolved. The time has come to settle the Kashmir issue. It is too dangerous to continue with the military intervention in Kashmir. It is not in our interest." The big question, however, is: "And what will India do then?" While Pakistan's nuclear weapons are not in the possession of the civilian government in Islamabad, there are growing concerns that it could use them to pressure and harass India, especially along the Line of Control (LoC). "I suggest Pakistan should leave Kashmir to India," he said. "It is India's policy to deal with Kashmir. India has shown its willingness to go ahead with the resolution of the Kashmir issue. Only a few years ago, when Kashmir was partitioned, India did nothing to respond and Pakistan was left to deal with it alone. We feel that the time has come. We are still appealing to India for a meeting to resolve Kashmir." Musharraf said the fact that he has been labelled a "terrorist", has a Pakistani passport and has been made to face international challenges in his home country is something he has not been able to escape. He said it has been possible for him to secure his release and freedom of movement, and that, to some extent, he has been doing the same for his colleagues on the other side of the border as well. But for the past 15 years, he has not been permitted to go anywhere in Pakistan. "

This invention relates to isomerization of a xylene stream containing at least about 15 wt. % ethylbenzene. The xylene isomers are produced in large volumes from petroleum as feedstocks for a variety of important industrial chemicals. The most important source of xylenes is catalytically reformed petroleum naphtha, by either of two processes: the Steam Reformed process, which uses a catalyst containing a noble metal, such as platinum, on support, and the Selective Catalytic Reformer process, which uses a special type of solid catalyst. The widespread utility of ethylbenzene is due to its important chemical and utility value. Ethylbenzene is typically combined with other xylenes, especially cumene, to form styrene. Ethylbenzene is currently produced from benzene by selective ethylene oligomerization over a catalyst of acidic γ -alumina, while cumene is currently produced by the cracking of acetone. When ethylbenzene is produced by such methods, large quantities of light olefins, such as propylene, are also produced. The light olefins may be used as feeds for the production of various plastics, but they can also be further processed to produce more products. For example, the light olefins can be converted to more valuable products, such as gasoline or fuel oils, by processes known as catalytic cracking and hydrocracking. The selective and parallel reforming of ethylbenzene has long been studied. In the 1960's, a modified form of the sulfur-tolerant zeolite

ZSM-5, called ZSM-20, was shown to catalyze the partial oxidation of ethylbenzene to acetophenone with regeneration of steam. Unmodified ZSM-5 zeolite was equally effective. In 1967, the reforming of ethylbenzene was patented by Mobil Oil Corporation (U.S. Pat. No. 3,251,891). The process was modified in the 1970's, and a ZSM-5 catalyst modified to contain niobia was used to increase the selectivity for ethanol. In 1978, it was shown that the ZSM-5 catalyst could be modified using alkali and/or alkaline earth metals (U.S. Pat. No. 4,097,543). In the 1980's, other methods, such as base cation treatment of the catalyst, the addition of alk
